DETAILED ACTION

Response to Arguments

The applicant's arguments as filed on 5/10/2010 in regard to the rejection(s) of claim(s) 8-13 under 103 (a) have been considered and are persuasive, further the examiner appreciates the applicant's detailed explanation of the inventions as claimed during the phone interview on 10/2010.

Allowable Subject Matter

Claims 8-13 are allowed.

In regard to independent claim 8, while, the prior art of record disclose of a speaker array system comprising: N driving circuits, N being an integer equal to or greater than 4; a plurality of N speakers arranged in an array, each of the N speakers making up plural pairs of speakers, each pair of speakers comprising a first speaker and a second speaker, each first speaker being positioned adjacent to the second speaker in the pairs of speakers, wherein in each pair of speakers, the one terminals coupled to the driving circuits have opposite polarity.

However, none of the prior arts of record as a whole, disclose of the wiring saving concept and delay concept that is the specific wherein each of the N speakers having two terminals, one of the two terminals being coupled to a corresponding one of the N driving circuits and the other of the two terminals being connected to together so

that $N + 1$ wirings are utilized in the speaker array system, and the first speaker receives a first driving signal at the one terminal from the corresponding one of the N driving circuits and outputs a first current signal at the other terminal, and the second speaker receives a second driving signal, having an inverse phase and a predetermined delay relative to the first driving signal, at the one terminal from the corresponding one of the N driving circuits and outputs a second current signal at the other terminal so that a magnitude of a sum of the first current signal and the second current signal is determined by a magnitude of the predetermined delay, wherein the first driving signal received by the first speaker and the second driving signal received by the second speaker are generated from one signal.

Similarly, in regard to independent claim 13, while the prior art of record disclose of speaker array system comprising: a two-dimensional speaker array comprising a plurality of N speakers, N being an integer equal to or greater than 4, each of the N speakers including a signal input terminal and a common terminal; a plurality of N driving circuits which drive the N speakers by driving signals; respectively and a plurality of N input terminals [[connected]] coupled to the N driving circuits to supply input signals to the N driving circuits, respectively and speaker of the N speakers which is connected to the inverter through the driving circuit is arranged physically adjacent to the speaker of the N speakers which is not connected to the inverter through the driving circuit.

However, none of the prior arts of record as a whole, disclose of the wiring saving concept and delay concept that is the specific wherein N wirings which connect the signal input terminals of the N speakers to outputs of the plurality of N driving circuits, respectively; a common wiring which connects the common terminals of the N speakers together; wherein the input signals are generated from one signal, and wherein the input signals which have same components, and to which predetermined delays are given, are input to the input terminals, respectively, so that a magnitude of a difference between the driving signals in the adjacent speakers is determined by a magnitude of the predetermined delay.
